Project Name	Real-Time Communication System Powered By AI For Special Abled

## **REAL-TIME COMMUNICATION SYSTEM POWERED BY AI FOR SPECIAL ABLED**

### **Abstract :**

Artificial intelligence is not designed to replace humans but rather to enhance our lives by helping us do things we are unable to do on our own. Many companies are working on this type of research, including Google Deep mind, IBM Watson, Apple Siri, Microsoft Cortana, etc., which means there will likely be many new developments soon. These innovations could positively impact everyone's life – even those without disabilities – because they make everyday tasks easier and less time consuming.

Here are a few technologies that have a direct impact on Special Abled lives. How can we make sure that disabled people are included in society? Facial recognition technology may be the answer. It's been over a decade since facial recognition technology has been a significant topic in the news. It made headlines in 2005 when it was used to identify the 9/11 terrorists. Ten years later, it seems that this high-tech innovation is being used less for catching criminals and more for making people feel secure.

Facial recognition technology is quickly becoming a part of everyday life. It's used to improve public security, the accuracy of photo tagging and even make grocery shopping easier. But those who can't speak or move. Facial

recognition has the potential to offer independence and inclusion for these individuals. This means that people with disabilities can get a job or go out without needing a caregiver or companion to help them find their way around and do things independently.
